

Tracing for deletion:

1) deleting a leaf node:

delete 50:

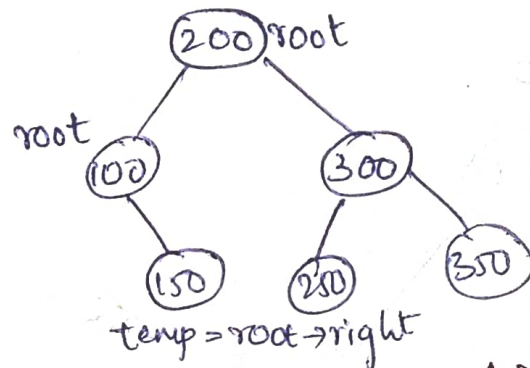

$50 < 200$ move left

$50 < 100$ move left

$50 = 50$

$root \rightarrow left = NULL \ \&\& \ root \rightarrow right = NULL$

$free(root);$

2) Deleting a node with one child:

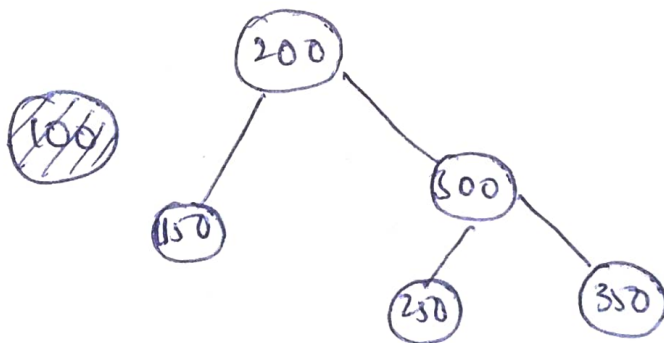

delete (100);

if (value < root → data)

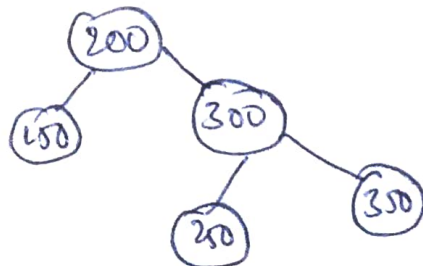

$root \rightarrow left = delNode(root, value)$

$temp = root \rightarrow right$ $temp = 150$

$free(root);$

3) deleting a node with two child:

root = 200 value = 300

if (value > root → data)

root → right

300 = 300

Find largest in right subtree of the root.

350 > 300.

300 = 350 [root = root → left → data]

free(root);
